

ABSTRACT OF THE DISCLOSURE

A method for fast thickening electroforming stamper, in which a substrate is placed in an electroforming tank and electroforming to form a first electroforming layer on the face of the substrate. A first thickening material is connected with a face of the first electroforming layer distal from the substrate. The first thickening material, the first electroforming layer and the substrate together form a combination body. After the substrate is separated from the first electroforming layer, at least the first electroforming layer and the first thickening material together form a stamper.
